

2-way power supply ups for base station

Overview

What is the difference between a upss2 and an AC power supply?

The UPSS2 is ideal for operating circuit breakers, powering substation relays or for unregulated charging of substation batteries. The AC power supply is a variable isolated power source (1-240 Vac) that can be used to power other equipment in the substation. Specifications are valid at nominal voltage and ambient temperature of +25°C (+77°F).

How many amperes can a DC power supply supply supply?

Both the AC and DC Voltage sources are capable of supplying 10 amperes continuously. The variable DC power supply (1-300 Vdc) is ideal for use as a substitute primary power source when station batteries are not available.

Why do you need an UPS system?

For longer outages, critical processes can be safely maintained using our UPS solutions to prevent unwanted impacts and data loss. The required buffer or bridging time, and thus the design of the uninterruptible power supplies, depends on the connected load and is determined before installation.

What is a capacitive uninterruptible power supply?

This will dictate the type and size of the energy storage. The capacitive uninterruptible power supplies are suitable as base devices for critical applications and high system availability, such as interconnected industrial systems in the automotive sector or in intralogistics, as well as for high-current applications with short buffer times.
