# 2V monocrystalline silicon solar panel

## Overview

---

What are polycrystalline and monocrystalline solar panels?

Polycrystalline and monocrystalline solar panels are both made from a arrangement of silicon cells. These types of silicon solar panels are known in the industry as 'mono' and 'poly' panels. In 2020, almost every consumer will use one of these 2 kinds of crystalline solar panels.

What is a monocrystalline solar PV module?

A monocrystalline solar PV module is fabricated from a single silicon crystal. The process involves purifying, melting, and then crystallizing the silicon into ingots, which are cut into thin wafers to produce individual cells. Monocrystalline PV modules are typically black or iridescent blue in color. The following are the key benefits of monocrystalline solar PV panels:.

Why is monocrystalline silicon used in photovoltaic cells?

In the field of solar energy, monocrystalline silicon is also used to make photovoltaic cells due to its ability to absorb radiation. Monocrystalline silicon consists of silicon in which the crystal lattice of the entire solid is continuous. This crystalline structure does not break at its edges and is free of any grain boundaries.

Are monocrystalline solar panels space-efficient?

Monocrystalline silicon solar panels are space-efficient. Their higher efficiency means that they produce more electricity each foot. This means they can create the same amount of energy with fewer cells, so smaller multi-story homes can rely on them. Monocrystalline panels have a very long lifespan.
