Overview

Which boron containing compounds are used in a supercapacitor?

The mono- and binuclear boron-containing compounds (B) and (B ← N) were the names of the synthesized electrodes. With 156.21 F/g specific capacitance in KOH electrolyte, binuclear boron-containing (B ← N) electrode material is a promising material for supercapacitor applications, according to all electrochemical studies.

Are boron carbon nitride nanomaterials suitable for supercapacitors?

However, the relatively low capacitance and low energy density limit the practical application of supercapacitors. In this context, boron carbon nitride (BCN) nanomaterials have been extensively studied in the past decade due to their chemical and thermal stability, high mechanical strength, as well as tunable bandgap.

Is borocarbonitride a supercapacitor electrode?

Among the two-dimensional (2D) supercapacitor electrodes, borocarbonitride (BCN) has sparked widespread curiosity owing to its exceptional tunable properties concerning the change in concentration of the constituent elements, along with an excellent alternative to graphene-based electrodes.
