

Can the solar container battery room use spray equipment

Overview

Do you need forced ventilation in a battery room?

Forced ventilation must be included in the room when it is impossible to achieve the necessary airflow through natural ventilation. The charger must be interlocked with the ventilation system, and the air from the battery room must be directed outside the building to ensure safety and proper ventilation.

How should a battery room be designed?

Battery rooms shall be designed with an adequate exhaust system which provides for continuous ventilation of the battery room to prohibit the build-up of potentially explosive hydrogen gas. During normal operations, off gassing of the batteries is relatively small.

Do recombinant batteries need ventilation?

Also since the hydrogen released to the surroundings is highly flammable and explosive; these types of batteries must be installed in a sufficiently ventilated room. Most industry codes specify 6 air-changes per hour in the battery room. We will learn more on ventilation later in this course. Recombinant cells have a starved or gelled electrolyte.

How much air space should be provided between batteries?

When connecting the batteries, free air space must be provided between each battery. The recommended minimum spacing between batteries is 0.2 inches (5mm) to 0.4 inches (10mm). In all installations, consideration must be given to adequate ventilation for the purposes of cooling.
