

Detection method of solar current leakage in battery cabinet

Overview

The method comprises the following steps: 1, a prepared solar battery plate is placed into a dark room, the back face of the solar battery is closely contacted with an objective table with good heat dissipation, the anode and cathode of the solar battery are connected with a constant voltage power supply, and the infrared thermal imager faces the light receiving face of the solar battery; 2, the solar battery is loaded with positive bias or negative bias by the constant voltage power supply, and an infrared thermal image is observed; 3, according to the display of the infrared thermal image, an obvious high-temperature zone, compared with nearby zones, is judged to be an electrical leakage zone; and 4, according to the position of the electrical leakage zone and performances of the electrical leakage zone under the positive bias and negative bias, the cause of the electric leakage is predicted. What is battery leak detection?

Leak detection is a key test for systems and components within the battery pack from cells, contactors, cooling system and the enclosure. Leaks in lithium-ion battery cells can shorten battery life and deplete energy capacity. Leaks also can allow moisture to enter the battery system.

How SVM based systems can be used to detect leakage current fault?

All aforementioned study deal with SVM based different strategies for fault detection in different systems where the proposed system developed rule-based classifiers for detecting sensor fault and load current fault and MSVM is applied for leakage current fault through proper classification in a household environment.

How a sensor-based monitoring device can detect leakage current fault?

For this, we developed a sensor-based monitoring device with long-range communication to store real-time data in a cloud database. In the modeling process, RBC algorithm is used to diagnose the constructed device fault and overcurrent fault where MSVM is applied for detecting leakage current fault.

How do Agilent leak detectors work?

Agilent leak detectors may be used in any of several ways to find or measure leaks. When a leak is encountered, helium is captured through the probe and detected by the sensor. Leak sites are identified quickly thanks to fast response time. In this configuration, a cumulative leak rate can be determined quickly and accurately.
