

# General Contracting of Rooftop solar Panels

## Overview

---

What is a rooftop solar installation?

A rooftop solar installation is a type of distributed generation, which is seen in many parts of the country as a way for cities and homeowners to modernize their power system and become more resilient in the face of extreme weather, brought about in part by climate change.

How does a rooftop solar PV system work?

It converts solar energy into electricity. This can be used to meet the building's own energy consumption requirements or, in certain situations, fed back into the electrical grid. Rooftop solar PV systems are distributed electricity generation options, which help to meet a building's energy needs, or provide electricity within.

Can a PV system be installed on a roof?

There are different mounting solutions. While PV systems add a relatively low additional load on a roof, it is still important to ensure that the overall system is in line with structural allowances, and that it does not compromise.

Who is responsible for roof design & construction?

The responsibility is shared between two parties: the building owner and the contractor. The building owner commissions the design and construction of the system, typically from two separate parties. Owner involvement is important, and oversight of each stage is required. O&M can be carried out by the owner or by appointed third parties. No guarantee on system performance and changes to the design.
