

Glass solar panel delamination

Overview

What is delamination of a solar panel?

He has 13 years of experience in photovoltaic sector, in particular in module production, certification and technical testing. Delamination of a solar panel is the detachment, even if partially, of the encapsulant from the glass or the backsheet: discover more on [Futurasun](#).

Why are solar panels prone to delamination?

Manufacturing Defects: Poor lamination or inadequate bonding during production can weaken adhesion between layers, making solar panels more susceptible to delamination. **Material Incompatibility:** Incompatibility between materials used in the module, such as the encapsulant and backsheet, can lead to delamination over time.

How does delamination affect the performance and reliability of solar panels?

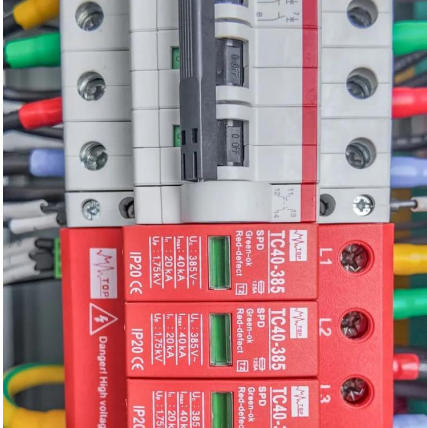

Delamination can have detrimental effects on the performance and reliability of solar panels: **Efficiency Reduction:** The separation of layers disrupts the current flow and can increase resistance, leading to a decrease in the overall efficiency of the module.

What happens if a solar module is delaminated?

Power Output Decline: Delamination can result in reduced power output due to electrical losses and compromised performance of the affected solar cells. **Structural Integrity Compromise:** Delamination weakens the mechanical integrity of the module, making it more susceptible to further damage and potential failure.
