Is solar glass 'practically clear'?

Some manufacturers have made big strides in the production of solar glass. Polysolar UK describes their solar glass as 'practically clear'. Polysolar UK use thin film photovoltaic (PV) technology which enables them to produce cells for solar PV panels that are entirely transparent or opaque.

What is solar glass?

Solar glass is a type of glass that is specially designed to harness solar energy and convert it into electricity. It is made by incorporating photovoltaic cells into the glass, allowing it to generate power from sunlight. This innovative technology has gained popularity in recent years as a sustainable and efficient way to produce clean energy.

How does solar glass work?

The glass is coated with thin layers of semiconductor materials, such as silicon, that can absorb sunlight and generate an electric current. When sunlight hits the solar glass, the photons in the light excite the electrons in the semiconductor material, creating an electric charge that can be harnessed as electricity.

What are the different types of solar glass?

There are several different types of solar glass available on the market, each with its own unique characteristics and applications. One common type is transparent solar glass, which allows light to pass through while still generating electricity.
