

# Solar inverter AC DC isolation

## Overview

---

Do photovoltaic inverters need an isolation transformer?

In photovoltaic installations with capacities higher than 20kW, inverters should be fitted with an isolation transformer, while for power ratings lower than 20kW the residual current circuit breaker for protection against indirect contacts should be type B when an inverter that does not have at least a simple .

What is the difference between AC and DC isolators?

Use Cases: AC isolators are commonly used in commercial HVAC systems, lighting, and industrial motors. DC isolators are essential in solar PV systems, battery banks, and EV chargers where consistent current flow is present. Never substitute an AC isolator for a DC system. Fire hazards escalate due to the high probability of sustained arcing.

Do solar power converters need isolation?

In a solar power converter, high-voltage and low-voltage circuits co-exist. Isolations are required between the high-voltage and low-voltage circuits for both functional and safety purposes. Fundamental isolation concepts and terminology are presented in references [3-4]. Digital isolators can be used to address the isolation requirements.

What isolation options are available for solar power conversion applications?

In response to these needs, Texas Instruments offers several isolation offerings for solar power conversion applications. These include isolated IGBT gate drivers, digital isolators, isolated delta-sigma ADCs and amplifiers, and isolated communication links such as isolated RS-485 and isolated CAN.
