

# **Solar module monocrystalline silicon**

## Overview

---

Is a monocrystalline solar panel a photovoltaic module?

Yes, a monocrystalline solar panel is a photovoltaic module. Photovoltaic (PV) modules are made from semiconducting materials that convert sunlight into electrical energy. Monocrystalline solar panels are a type of photovoltaic module that use a single crystal high purity silicon cell to harness solar power.

Why is monocrystalline silicon used in solar panels?

Monocrystalline silicon is used to manufacture high-performance photovoltaic panels. The quality requirements for monocrystalline solar panels are not very demanding. In this type of boards the demands on structural imperfections are less high compared to microelectronics applications. For this reason, lower quality silicon is used.

How do monocrystalline solar panels work?

For instance, the solar cells in mono panels are coated with silicon nitride, which minimizes reflection and maximizes sunlight absorption. Another characteristic that contributed to the superior efficiency of monocrystalline panels is the use of metal conductors printed onto the cells, which enables efficient electricity collection.

How are monocrystalline panels made?

The manufacturing process for monocrystalline panels begins with melting raw silicon, which is then used to grow a single crystal silicon ingot (block of solid silicon) following a process called the Czochralski method, so named for the Polish chemist who discovered it.
