## Overview

---

What is a battery thermal management system (BTMS)?

A Battery Thermal Management System (BTMS) is an integrated cooling and heating system designed to regulate the temperature of onboard batteries. It consists of key components such as a compressor, condenser, expansion valve, evaporator, water pump, expansion tank, PTC liquid heater, and essential control units.

What is battery thermal management?

Battery thermal management is required to regulate the temperature of the battery or battery pack into an appropriate range. Some thermal management methods, such as air cooling, liquid cooling, and heat pipe cooling, are developed to dissipate generated heat and prevent temperature rise.

What is a thermal control unit?

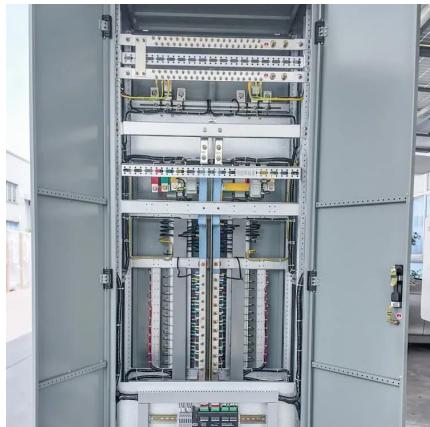

Thermal Control Unit: This component manages all activities in the battery thermal management system, including processing power from sensors, setting fan speeds, operating liquid pumps, and controlling heat elements. Additionally, this control system is typically integrated with the Battery Management System (BMS).

What is a battery thermal management system (PCM)?

PCM typically utilizes materials that can absorb or release heat during phase changes to regulate battery temperature. The material used in this type of battery thermal management system is generally one that can change shape from a solid to a liquid and back again.
