

# **What to do if the base station runs out of power**

## Overview

---

How to reduce the energy consumption of a base station?

So when the inter-cell distance is too large, it is necessary to increase the distance between cells, thus reducing the power consumption of the base station. In the actual network, in order to reduce the energy loss caused by frequent switching, the following two methods can usually be used: increase the distance between cells.

How do you open a valve base station?

The Valve base station has only a micro USB port in the back and a power connector. Disconnect your base station from the power. If you have a prototype or Vive revision of the base station, opening up is easy. Just remove the bottom rubber layer (it is stuck by a double sided tape) and you will see the screws for opening it up.

Why does a base station lose a lot of power?

Because switching is a continuous process and the base station is a device that works periodically, the switching loss accounts for a large proportion of the total power consumption of the base station.

What should I do if my power line goes down?

Surge protectors can also help. Report your outage to the local utility so they know that service is down, and provide any information you may have about power line damage to speed up repairs. Some utilities allow you to check for known outages. Here are 12 things you can do to be better prepared when the grid goes down.
