# Yaounde energy storage explosion-proof container door- to-door installation

## Overview

---

Can lithium-ion battery energy system thermal runaways cause explosion hazards?

Explosion hazards can develop when gases evolved during lithium-ion battery energy system thermal runaways accumulate within the confined space of an energy storage system installation. Tests were conducted at the cell, module, unit, and installation scale to characterize these hazards.

Can thermal runaways cause explosion hazards?

A specific consequence is that propagating thermal runaways can create explosion hazards by producing readily ignitable gaseous environments; deflagrations occurred in all three tests, with multiple deflagrations occurring in Test 2.

How much vent gas does an ISO container deflagration system produce?

of 28.7 m<sup>2</sup>, or again, 99% of the available 28.8 m<sup>2</sup> roof area. To bring these figures into perspective, for the 130 Ah capacity cells which produce the average 154 L of vent gas each, 6.9 cells will produce the volume of vent gas that maxes out the capabilities of the 8-ft ISO container deflagration protection system, with th.

Are there electrical interconnections in the ISO container?

There were no electrical interconnections. The “Initiating Unit” was positioned in the back corner of the ISO container. One “Target Unit” was positioned to the left of the Initiating Unit; one target unit was positioned across a 0.9 m (35 in.) aisle.
